The invention is useful for the diagnosis, prevention and/or treatment of diseases and conditions associated with aberrant expression and activity of breast cancer-1 such as a hyperproliferative disorder in particular breast, ovary, prostate and peritoneum cancers. The invention is also used in antisense therapy. The present sequence is human breast cancer-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "Phosphorothioate backbone where all cytidines are 5'- methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating conditions with aberrant activity of breast cancer-1, such as breast, ovary, prostate and/or peritoneum cancers.
                                                                                                                                                                                                             Gaps
portion of HDAC-1, preferably chimeric or hybrid HDAC-1 antisense oligonucleotide. Sequences ADI34722-ADI34746 represent HDAC isotypespecific antisense and mismatch oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Breast cancer-1; diagnosis; hyperproliferative disorder; cancer; antisense therapy; human; antisense; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotrion (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                          Human endothelial lipase antisense oligonucleotide, SEQ ID 1795
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human endothelial lipase antisense oligonucleotide, SEQ ID 2362.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 6 A; 4 C; 3 G; 7 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
Note: This sequence given in example 15 of the that given in the sequence listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to breast cancer-1 proteins and their encoding nucleic acids. The invention is useful for the diagnosis, prevention and/or treatment of diseases and conditions associated with aberrant expression and activity of breast cancer-1 such as a hyperprollicrative disorder in particular breast, ovary, prostate and peritoneum cancers. The invention is also used in antisense therapy. The present sequence is human breast cancer-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention is directed to novel antisense compounds targetted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating conditions with aberrant activity of breast cancer-1, such as breast, ovary, prostate and/or peritoneum cancers.
                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human histone deacetylase coding sequence antisense oligonucleotide #17.
                                                                                                                                                                                 /mcve="This oligonucleotide has a phosphorothioate /note="This oligonucleotide" (2'-MOE) wings at the 5' backbone and 2-methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all cytidine residues are 5-methylcytidines"

histone deacetylase inhibitor; HDAC inhibitor; antisense oligonucleotide; proliferative disease; proliferative condition; ss; HDAC8.
                                                                                                                                                                                                                            The present invention relates to benzamide derivatives capable of inhibiting histone deacetylase (HDAC) enzymes. These are useful in the treatment of a cell proliferative disease or condition in a mammal (preferably human). The present sequence is an antisense oligonucleotide for use against a human histone deacetylase gene.
                                                                                                                                                           New benzamide derivatives, useful to treat cell proliferative disease or conditions, are histone deacetylase inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises histone deacetylase (HDAC) inhibitors of the formula: N-(2-Amino-phenyl)-4-[(4-pyridin-3-yl-pyrimidin-2-ylamino)-methyl]-benzamide. The invention also comprises a method of inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New N-(2-Aminophenyl)-4-((4-pyridin-3-yl-pyrimidin-2-ylamino)-methyl)-benzamideis histone deacetylase inhibitor useful to treat cell proliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human histone deacetylase (HDAC8) gene-specific antisense oligo #2.

It was used with other primers (see AAT66952 and AAT6694-55) to amplify AGPR H1 cDNA from human liver cDNA. The isolated clone can be used to produce soluble AGPR H1 derivatives (see AAW15249-50) useful in a claimed method for detecting or measuring anti-AGPR antibody. The appearance of autoantibodies against AGPR is an indicator of autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Asialoglycoprotein receptor H1; AGPR; autoimmune hepatitis; autoantibody; liver; diagnosis; human; primer; PCR; polymerase chain reaction; ss.
HDAC in a cell. The HDAC inhibitors of the invention are useful for treating cell proliferative diseases and conditions. The present DNA sequence represents a human HDAC gene-specific antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Asialo:glyco:protein receptor H1 and L-H2 soluble derivatives - comprise extracellular domains, optionally also with cytoplasmic domains, useful for autoimmune hepatitis diagnosis.

The sequences at a number of polymorphic sites are also provided diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mccarthy JJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                          polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

The invention describes movel origonacectaes derived from microsatellite markers and used for the amplification of the rose genome.

The invention also describes a test kit for genetic analysis of cultured or wild forms of the genus Rosa sp. that contains at least one of the new oilgonucleotide primers and preparing microsatellite markers of Rosa sp. by PCR amplification of hypervariable genomic regions, using at least one of the new oilgonucleotide primers and preparing microsatellite markers of Rosa sp. by PCR amplification of hypervariable genomic regions, using at least one of the primer pairs flank the microsatellite locus being amplified. The amplified markers are separated by electrophoresis, complicied. The amplified markers are separated by electrophoresis, complicied are detected by staining (ethidium bromide or silver), candioactive labelling and autoradiography, automated or silver), candioactive labelling and autoradiography, automated or silver), complicied and the cells tested against a high-demsity array of synthetic microsatellites. Inserts in plasmids that hybridised were sequenced and coli and the cells tested against a high-demsity array of synthetic microsatellites. Inserts in plasmids that hybridised were sequenced and constanting and labelling of mono- or poly-genic traits, selection, analysis of cultivated and wild types of roses, particularly for genetic mapping and labelling of mono- or poly-genic traits, selection, analysis of contrive detection of hybrids and plant breeding. The purity, identification of hybrids and plant breeding. The commercial rose varieties. Abless74 represent the PCR primers commercial rose varieties. Abless74 represent the PCR primers commercial commercial rose varieties. Abless74 represent the PCR primers commercial rose warieties. Abless74 represent the PCR primers commercial rose warieties. of the invention.

The present invention relates to a method for determining predisposition to developing cancer in subject, particularly for a subject having anticone to developing cancer in Subject, particularly for a subject having anticoners and the subject that the subject having anticoners are subject to the later and the subject and subject to the later of developing cancer. Also claimed are small interfering RNA (sIRNA) according an end of the later of development of a cancer in a subject. The invention is also useful for treating or preventing diseases such as systemic anaphylaxis or treating to preventing diseases such as systemic anaphylaxis or treating to preventing diseases fund allergies, inflammatory dermaticis), of dermatitis, allergic contact dermatitis), cephalosporins), insect sting allergies, inflammatory dermatitis), cephalosporins, allergic dermatitis, allergic contact dermatitis), cephalosporins allergic dermatitis, allergic contact dermatitis), cephalosporins allergic dermatitis, allergic contact dermatitis), content dermatitis, allergic respiratory allergic dermatitis, allergic rhintis, content of allergic manner of a cancer contact dermatitis), content dermatitis, content dermatitis, content dermatitis, content of a cancer content dermatitis, content dermatitis, content dermatitis, content of a cancer content dermatitis, content of a cancer c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining cancer cell or predisposition to developing cancer in subject candidate for anti-tumor necrosis factor therapy, by determining level of expression of B cell activation factor gene in sample of subject.

This sequence represents a PCR primer that can be used in the method of the invention. The method is for genetic diagnosis using human mitochondrial DNA where there is at least one base replacement from among the following five replacements: the 3010th base is changed from guanine to adenine; the 4883rd base from cytosine to thymine; the 5178th base from cytosine to thymine; the 14668th base from cytosine to thymine. The method can be used for diagnosing the probability of contracting adult diseases. A confirmation of base replacement can give a diagnosis of the level of probability of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LAR; leukocyte antigen related protein; LAR inhibitor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a compound (I) comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding LAR (leukocyte antigen related protein), where (I) specifically hybridises with the nucleic acid and inhibits expression of LAR. Also described: (1) a composition comprising the expression of LAR in cells or tissues; (3) treating an animal having or suspected of having a disease or condition associated with LAR; and (4) screening for an antisense compound. (I) has cytostatic activity, and can be used in gene therapy. The antisense oligonucleotide ecompound (I) can be used for preparing a composition for treating metabolic or hyperproliferative disorders, particularly cancer. The present sequence represents a human LAR chimeric phosphorothioate
                                                                                                                                                                                                                                                                                                                                                                                   New compound comprises a sequence targeted to a nucleic acid encoding Leukocyte Antigen Related protein (LAR), useful for preparing a composition for treating metabolic or hyperproliferative disorders, e.g.

The invention involves producing transgenic animals with sometic animals with contain a transgene whose expression can interfere with sperm's ability to undergo fertilisation. The transgene is placed under control of post-meiotic spermatogenesis-specific promoters, and is inserted on to one of the sex chromosomes. The present sequence represents a PCR primer used to amplify a fragment of murine tspy pseudogene (testis specific protein Y-linked). The DNA fragment is used in an example illustrating the method of the invention where the transgene is targeted to the tspy locus on the Y chromosome. The method is useful for producing transgenic animals having sometic/germ cells containing one or more transgenes whose expression results in alteration
                                                                    Sex determination; ratio; offspring; transgenic animal; PCR primer; tspy; testis specific protein Y-linked; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing transgenic animals, involves creating transgene whose expression interfere with sperm's ability to undergo fertilization, and placing it under post-meiotic spermatogenesis-specific promoter control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes a short interfering nucleic acid (siNA) chat downregulates expression of a mitogen-activated protein kinase that downregulates expression of a mitogen-activated protein kinase codulating expression of MAPK genes in cells, tissue explants or coganisms by introduction of MAPK genes in cells, tissue explants or crystaling expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo corganisms by introduction of siNA; (2) kits for in vitro or in vivo corganisms by introduction and cells containing these vectors. MAPK siNAs contasthmatic, annoractic, antiplacteria, antiminammatory, antischmatic, antiplacteria, antiminammatory, antischmatic, antischmatic and gastrointestinal activities. The MAPK contained contained the expression of MAPK genes, in cells, siNAs can be used to modulate the expression of MAPK genes, in cells, cissue explants or organisms, e.g. for treating obseity; diabetes types I tissue explants or organisms, e.g. for treating obseity; diabetes types I compute shock, rheumatoid arthritis, psoriasis and inflammatory bowel containing sene function and sene mapping (e.g. of single-nucleotide cutomic represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated protein kinase genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase that downregulates expression of a material to a method for modulating expression of MAPK genes in cells, tissue explants or corganisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) evertors that express siNA and cells containing these vectors. MAPK siNAs vectors that express siNA and cells containing these vectors. MAPK siNAs antiasthmatic, annuosuppressive, antibacterial activities. The MAPK antisachmatic, antipsoriatic and gastrointestinal activities. The MAPK alsa can be used to modulate the expression of MAPK genes, in cells, siNAs can be used to modulate the expression of MAPK genes, in cells, and II; a wide range of tumours, and inflammatory disabetes types I septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; pharmacogenomics; incomplement of the contained of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                studying gene function and gene mapping (e.g. of single-nuclectide polymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          short interfering nucleic acid; siNA; downregulation; inhibition; mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anorectic; antidiabetic; antiinflammatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarthritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                               The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3 'terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synchesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                   ecting sequence of RNA interference useful for synthesizing siRNA, by secting regions in sequence fulfilling specific criteria such as base 3' terminal is adenine, thymine or uracil, base at 5' terminal is

The invention relates to an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleotide is a single nucleotide polyworphism (SNP) selected from any one of the nucleotide content of the relation (SNP) selected from any one of the nucleotide content of the properties (SNP) selected from any one of the nucleotide content of the species of SNP of SNP of diagnostic reagents and the Gevelopment of the rappeutic agents, as well as for disease association and individual who is at an increased or decreased risk for developing an individual who is at an increased or decreased risk for developing an autoimmune disease such as rheumatoid arthritis, type 1 diabetes, as the primary systemic lupus erythematosus, inflammatory bowel disease, psystemic lupus erythematosus, inflammatory bowel disease, or primary systemic vasculitis, Methods associated with the SNPs are useful for early detection of the disease, myocarditis, cthe surchamna diseases particularly rheumatoid arthritis, and for the autoimmune diseases particularly rheumatoid arthritis, and for screening and selecting therapeutic agents. The SNPs are useful for treating the diseases defined above. The nucleic acid molecules are useful for constructing the disease defined above. The nucleic acid molecules are useful for constructing host cells expressing a part or all of the cucleic acid molecules and variant peptides, for constructing transgenic condens. The nucleic acid molecules are useful for constructing host cells expressing a part or all of the capted as and variant peptides, for constructing transgenic confinence acid molecules and variant peptides, for constructing transgenic confinence acid molecules and variant peptides, for constructing transmission, or for gene therapy in patients whose cells have aberrant constructing region. This sequence corresponds to a PCR primar which containing region. However these sequence are not provided in the specification, however these sequence are not provided in the specification,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

AAT36149-T36174 are PCR primers derived from intronic sequences of human homologue of the murine Int6 gene located at chromosome 15 of a mouse genome. The primers are used for detecting mutations within the human Int6 gene. The Int6 gene is associated with MMTV (mouse mammary tumour virus) integration into a host genome during tumourigenesis. Primers and probes can be used in assays to diagnose MMTV infection, or any other int6 gene integration. Antibodies against the Int6 protein can be used in
                                                                                                                                                                                                                                                                           DNA encoding Int6 tumour associated protein - and use of reagents derived from them in cancer gene therapy, vaccines, diagnosis and immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mouse mammary tumour virus; MMTV; cancer; immunotherapy; gene therapy; prenatal screening; foetus; vaccine; primer; polymerase chain reaction;

The sequences given in AA172500-23 are primers which were used to amplify the human Int6 coding sequence. The primers were derived from the intromic sequences which border the 5' and 3' ends of each excon of the intromic sequences which border the 5' and 3' ends of each excon of the human Int6 gene. Human Int6 is organised into 13 exons as is the murine line gene, and contains a CA-repeal in the 7th intron. Human Int6 has been localised to chromosome 8, more specifically to 8022-q4. Int6 is an integration site for mouse mammary tumnour virus (MMTV), which causes integration in mammary tumnours. The Int6 protein has been found to be integration in mammary tumnors. The Int6 protein has been found to be integration in mammary tumnors that Int6 is earving a basic life control. The method of the invention comprises assaying a sample to function. The method of the invention comprises assaying a sample to detect a human Int6 nucleic acid sequence, or its fragment, by contacting contession or loss of expression of the variant is associated with expression or loss of expression of the variant is associated with expression or loss of expression of the variant is associated with expression in the Int6 gene can provide diagnostic and prognostic conformation. The method is useful for prenatal screening of a foetus or to mothations in the Int6 gene can provide diagnostic and prognostic conformation. The method for the variant of preventing cancer. The conformation in the Int6 gene can provide diagnostic and prognostic conformation. The method for the tracting of preventing cancer. The conformations in the Int6 gene can provide diagnostic and prognoses of Int6 gene conformations in the Int6 gene can provide diagnostic and prognoses of Int6 gene conformations in the Int6 gene can provide diagnostic and prognoses of Int6 gene conformations in the Int6 gene preventing concer. The method of the formations in the Int6 gene preventing concer. The method of the formations in the Int6 gene preventing concer. The method of the formati

                                                                                                                                                                                                                                  ö
                                                                                                            PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases unch as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, cervicitis, calpingitis, participatitis, bartholinitis; peneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse; interleukin-5; IL-5; signal transduction; antisense oligonucleotide; antiasthmatic; immunosuppressive; cytostatic; IL-5 receptor-alpha; asthma; eosinophilic syndrome; infection; inflammation; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is an oligonucleotide used for antisense modulation

of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The artisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to controlling cell behaviour by modulating the processing of a selected wild-type mRNA target in the cell, is new. The mRNA is bound to a specific-binding antisense compound that does not cleave bound mRNA. The antisense oligonuclectides are useful as research reagents, diagnostic agents (in hybridisation assays), and for treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         methoxyethoxy residues. The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates (b) a primer designed based on the chromosome marker comultiwell plates; (b) a primer designed based on the chromosome marker complished product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order cof the markers is changed so that the same discrimination Nos. succeed to of the markers is changed so that the same discrimination Nos. succeed to che maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal compliance in the multiwell plates of the specified configurations of incertions; (f) the mixed clones are cultured and the constituted are ampolified products; (h) the clones in the multiwell cresultant cultures are specified from the detected from the amplified products; (h) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42977 to ABL45222 represent creconstituted as the man analysis. BNN, and ABL45323 to ABL45534
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
does not elicit cleavage of the mRNA upon binding. The method of the invention can be used in therapeutics (i.e antisense therapy), including prophylaxis, and as a research tool. It is used for controlling the behaviour of a cell (especially responses such as apoptosis, mitosis, differentiation and quiescence to stimuli such as stress, hormones, cytokines and other signalling molecules), tissue or organism through antisense modulation of mRNA processing. The current sequence represents a mouse IL-5R (interleukin-5 receptor) antisense oligonucleotide uniform bround account of the season of the seas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

The antisense nucleic acids of the invention are useful for the treatment of pathological disorders by the modulation of cell adhesion which affects platelet aggregation, immune functions, tissue repair, cell proliferation, tumour invasion, inflammation and inherited diseases. Disorders which can be treated include: cancer; restenosis after angioplasty; stenosis to vein bypass; chronic inflammatory diseases (e.g. Chron's disease and rheumatoid arthritis); ocular neovascular disease and rheumatoid arthritis); ocular neovascular disease and inflammatory skin disorders dismandian oral cavity (e.g. gingivitis); and inflammatory skin disorders (mammallan oral cavity present DNA sequence represents an antisense nucleic acid of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense nucleic acid against alpha V integrin for use in pharmaceutical compositions for the specific inhibition of the expression of alpha integrins in mammalian cells useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense nucleic acid; ss; alpha-V integrin chain; antisense inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cell adhesion modulation; platelet aggregation; immune function; tissue repair; cell proliferation; tumour invasion; cancer; gingivitis; chronic inflammatory disease; Chron's disease; rheumatoid arthritis; cular neovascular disease; diabetic retinopathy; osteoporosis; excessive bone resorption; inflammatory skin disorder; psoriasis.

The invention relates to an isolated intracellular signaling polypeptide, termed Nod2, comprising a sequence of 1007 or 1040 amino acids, given in the specification. The nucleic acid encoding the isolated procein is useful for identifying subjects at risk of developing Crohn's disease by providing a nucleic acid from the subject, where the nucleic acid comprises a Nod2 gene, and detecting the presence or absence of one or more variations in the Nod2 gene. Detecting comprises comparing the acid. Detection is accomplished by hybridisation analysis. The method further comprises determining if the subject is at risk of developing crohn's disease based on the presence or absence of the variations, and cturther comprises determining if the subject is at risk of developing crohn's disease based on the presence or absence of the variation, and cturther comprises agnorype relative risk or a population attributable risk for the subject. The variation is a polymorphism or a mutation causes a preferably a cytosine residue insertion, where the mutation causes a confinence of the Nod2 gene. The isolated protein is useful as a target for screening drugs that can alter, for example, RICK signaling, and thus the physiological effects of NF-kappa B. The Nod2 gene is useful for producing the isolated protein by recombinant techniques, as starting for producing the isolated protein by recombinant tissues or plant calls as compared to wild-type plants, plant tissues or plant cells as compared to wild-type plants, plant tissues or plant the invariant or manna or the plants of the prepagator of the plants, plant tissues or plant the invariant or manna plants.

The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense to adjagonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful mammalian IL-5 or modulating the expression of mammalian IL-5 or modulating the expression of mammalian in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence

```

```
The present invention relates to novel antisense oligonucleotides (ABZ81522-ABZ81593) which are targeted to human protein kinase A (PKA) regulatory subunit RII beta nucleotide sequence (ABZ81513), and which specifically hybridise with and inhibit the expression of the PKA regulatory subunit RII beta (PKA is also known as CAMP-dependent protein kinase). The antisense oligonucleotides are useful for modulating the expression of PKA regulatory subunit RII beta and for treating diseases or conditions associated with aberrant expression of PKA regulatory subunit RII beta, e.g. diabetes or cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "Oligonucleotide has phosphorothicate backbone and all cytidine uncleotides are 5-methylcytidine. Optionally some nucleotides with 2'-methoxyethyl (2'-MOE wings) modification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides targeted to nucleic acid encoding protein kinase A regulatory subunit RII beta, useful in treating diseases e.g. cancer associated with the aberrant expression of the protein kinase.
                                                                                                                                                                                                                       PKA regulatory subunit RII beta antisense oligonucleotide ISIS #114487.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                         Human, cytostatic, antidiabetic, antisense therapy; phosphorothioate; protein kinase inhibitor; protein kinase A; PKA; regulatory subunit RII beta; cAMP-dependent protein kinase; diabetes; cancer; infection; inflammation; tumour; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel antisense compounds targetted to a nucleic acid encoding human phospholipid scramblase 4 (also known as PLSCR4, HUPLSCR4, MUPLSCR4 and LOC57088) to inhibit its expression. Antisense compounds of the invention are useful for preparing compositions for treating neurodegenerative diseases, e.g. hyperproliferative or autoimmune disorders. The invention is also useful in gene therapy. The present sequence is an antisense oligo targetted to human PLSCR4 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New compound, useful for preparing a composition for treating hyperproliferative or autoimmune disorders, comprises a sequence targeted to a nucleic acid encoding human phospholipid scramblase 4.

The invention relates to the treatment and prevention of cancer comprising a compound that inhibits the activity of protein or peptide fragment of a fully defined amino acid sequence TLR1 given as SEQ ID NO 1. TLR1 is useful in the treatment and prevention of cancers of the large intestine, mammary glands, lung, prostate, digestive tract, stomach and present sequence is that of a human TLR1 related for the result of a human TLR1 related PCR primer used in examples of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treatment and prevention for cancer of the e.g. digestive system, liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, conse in antisense gene therapy. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a conse in antisense gene therapy. The composition may have a conse in antisense gene therapy. The composition may have a conse in antisense gene therapy. The composition may have a consent an autisense gene therapy. The composition may have a consent of or enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine or receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Unug allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrom; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;
                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                 Aguilar D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction respiratory tract inflammation, allergies and bronchoconstriction or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating cyptuction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery construction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery considered in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of instructions for adding a carrier and for use of the kit. The composition of instructions and antialergic, antiinflammatory, antiasthmatic, or composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition or availability, or to increase the degradation of the target mRNA or to composition, and/or bronchoconstriction and/or lung or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The undantion, allergies and/or bronchoconstriction and/or lung inflammation, allergies asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructions be prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target encounted encounted to the objection emphysema. Gaps Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent. The invention relates to a method for treating airway hyperresponsiveness or pulmonary inflammation in an individual comprising administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention also relates to a method of inhibiting a human expression of a nucleic acid molecule encoding B7-1 or B7-2. The antisense compound is an antisense oligonucleotide which has a modified sugar molety and nucleobase. The human B7 protein is human B7-1 or B7-2 protein or both. The compound is useful for treating airway propensionaiveness or pulmonary inflammation, which is associated with asthma, by inhibiting expression of human B7 protein. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antilipaemic, Cardiovascular, Analgesic, Antianginal, Antisense therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; a T3 promoters site; at least on Tag gene comprising at least 5 20mer Tag sequences; a Poly A site having at least 21 consecutive A residues; a second restriction endonuclease site which may be the same or different than the first restriction endonuclease site; or a T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA molecules made by annealing and extending overlapping 60mer oligonucleotides, useful in producing synthetic Tag genes useful as assay controls, in assay development, product development and for quality

Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                                             The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human endothelial lipase antisense oligonucleotide, SEQ ID 1168.
                                                                                                                                                                                                                                                                   New antisense oligonucleotide for modulating endothelial lipase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "cdd base OTHER /mod base a phosphorothioate /mod base = This oligonucleotide has a phosphorothioate /note = "This oligonucleotide idea" wings at the 5' backboone and 2-"methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; {\rm HDL}_1; cardiovascular disorder; metabolic syndrome X_1; ss.
                                                                                                                                                                                                                                                          The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human endothelial lipase antisense oligonucleotide, SEQ ID 1692.

                                                                        New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                 The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mouse; ss; PCR; cancer; prostate cancer; neuroblastoma; leukaemia; inflammation; arthritis; inflammatory skin disorder; insulin dependent diabetes; adult respiratory distress syndrome; cell death-related disorder; Alzheimer's disease; Parkinson's disease; multiple sclerosis; AIDS; septic shock; stroke; osteoporosis; ischaemia; reperfusion injury; myocardial infarction; appetite; immune response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polymucleotides encoding short polypeptides, for preventing and treating disease conditions associated with the activity of the polypeptide, e.g. inflammation, cancer, arthritis, insulin-dependent diabetes or osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antigen; anaphylaxis; primer; RT-PCR; reverse transcriptase PCR

The invention relates to an isolated mouse polymucleotide having a nucleotide sequence of a clone consisting of 1110005117, 1700007F22, 1700101122, 1700056N9, 2310014H11, 2310031021, 4930651801, 9130004105, 9320110A19, 9230111007, A030004E11, A430045L05, A530065117, A630010816, E2310114010, E2303152020, C230071E12, C630041L24 or D630020916, is new. The CC clones 1110005117, 1700007F22, 1700011022, 1700056N99, 2310014H11, C331004102, A330045L05, A530065117, A830010816, B230114010, B230352020, C230074H11, C3310041C01, 493055B01, 913004105, 9230114007, A030004B11, A330045L05, A530065117, A330010816, B230114010, B230352020, C230071B12, CC C30041L24 and D630020916, appearing as ADK19702-ADK19720. The polymucleotides and proteining applications, and prevention and treatment of disease conditions applications, and prevention and treatment of disease conditions applications, architis, chronic inflammatory conditions of the skin, insulin-dependent diabetes, adult respiratory distress syndrome, or disease, septic shock, stroke, osteoporosis, ischaemia, repertuaion injury, ADS or myocardial infarction. The polypeptides are also useful cincreasing antibody production in response to an antigen, inhibiting anaphylaxis, and reducing inflammation. The present sequence is a reverse cranscriptase PCR (RT)-PCR primer used to isolate a mouse polymucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding cyclin-dependent kinase 6, useful for treating cancer, bacterial/viral infection or conditions involving aberrant

Example 15; Page 32; 68pp; English

```
The invention relates to antisense oligonucleotides targeted to cyclindependent kinase 6, and which inhibit the expression of cyclin-dependent kinase 6. The antisense oligonucleotides are useful for treating a disease or condition associated with cyclin-dependent kinase 6, such as a hyperproliferative disorder (e.g. cancer), or conditions arising from bacterial or viral infections, or involving aberrant apoptosis. They are also useful in research and diagnostics for modulating the expression of cyclin-dependent kinase 6. The present sequence represents a cyclindependent kinase 6 antisense oligonucleotide. Note: Seqid 15-134 are also used in the sequence listing but these sequences do not match seqid 15-134 displayed in Tables 1 and 2 (page 30-34).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /mod_base= OTHER

The Inté protein deregulates mammary epithelial cellular growth. The cDNA and protein are useful as vaccines for treating cancer. This sequence represents a PCR primer used to amplify cDNA encoding the human Inté protein of the invention.
             The invention relates to antisense oligonucleotides targeted to cyclindependent kinase 6, and which inhibit the expression of cyclin-dependent kinase 6. The antisense oligonucleotides are useful for treating a disease or condition associated with cyclin-dependent kinase 6, such as a hyperproliferative disorder (e.g. cancer), or conditions arising from bacterial or viral infections, or involving aberrant apoptosis. They are also useful in research and diagnostics for modulating the expression of cyclin-dependent kinase 6. The present sequence represents a cyclindependent kinase 6 antisense oligonucleotide. Note: Seqid 15-134 are also used in the sequence listing but these sequences do not match seqid 15-134 displayed in Tables 1 and 2 (page 30-34).
                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel tumor Int6 recombinant protein that deregulates mammary epithelial

Also described are: a method of inhibiting the expression of Interleukin 18 in cells or dissues, a method of screening for a modulator of Interleukin 18; a diagnostic method for identifying a disease state; a kit or assay device comprising the compound; and a method of treating an animal having a disease or condition associated with Interleukin 18. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder such as cancer. This sequence represents a human interleukin-18 (IL-18) antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New oligonucleotide compound that inhibits expression of Interleukin 18, useful for preparing a composition for treating hyperproliferative disorder e.g. cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding Interleukin 18, that specifically hybridises with the mucleic acid encoding Interleukin 18 comprising 23865-bp sequence and inhibits expression of Interleukin 18. Also described are: a method of inhibiting the expression of Interleukin 18 in cells or Lissues; a method of screening for a modulator of Interleukin 18; a diagnostic method for identifying a disease state; a kit or assay device comprising the compound; and a method of treating an animal having a disease or condition associated with Interleukin 18. The oligonucleotide compound is useful for preparing a composition for treating having a hyperproliferative disorder such as cancer. This sequence represents a human interleukin-18 (IL-18) antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide compound that inhibits expression of Interleukin 18, useful for preparing a composition for treating hyperproliferative disorder e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                           1. .20

The invention relates to an antisense compound that modulates interleukin CC -5 (IL-5) signal transduction. The antisense compound is an antisense oligonucleotide targeted to a nucleic acid molecule encoding a mammalian consideration of mammalian IL-5 or IL-5 receptor a. The antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense captesion of mammalian IL-5 or IL-5 receptor a. The antisense coligonucleotide comprises at least one modified internucleoside linkage, consoliditied sugar molety, i.e. 3 -0-methoxyethyl sugar molety, and at modified sugar molety, i.e. 5 -methoxyethyl sugar molety, and at consoliditied mucleobase, i.e. 5-methoxyethyl sugar molety, and at consoliditied nucleobase, i.e. 5-methoxyethyl sugar molety, and at consoliditied mucleobase, i.e. 5-methoxyethyl sugar molety, and at consoliditied mucleobase, i.e. 5-methoxyethyl sugar molety, and at compound so that the ratio of the mammalian IL-5 receptor a in mammalian cells or altered. Treating a mammal having a disease or condition characterised by a reduction associated with a disease or condition characterised by a reduction in approcase comprises compound so that IL-5 receptor a expression, or IL-5 receptor a signal transduction, IL-5 or IL-5 receptor a substitute of an antisense compound so that IL-5 receptor a is modulated, the ratio of IL-5 receptor a is modulated. The antisense compounds, methods and compositions are useful in promoting apoptosis and in treating eosinophilic syndrome and
                                                                                                                                                                                                                                                                                                                               Murine interleukin-5 (IL-5) receptor a DNA antisense oligonucleotide #72.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound modulating interleukin-5 signal transduction, useful in promoting apoptosis and in treating eosinophilic syndrome or

The lambda ZAPII cDNA library was mde from mRNA of a human female fetal CC (17-18 week gestation) brain, using both oligo (dT) and random- sequence (17-18 week gestation) brain, using both oligo (dT) and random- sequence CC primers. A 500-bp PCR product, corresp. to part of the coding region (547 1-1047) of the rat orphan receptor was used to screen the human fetal coling region of the rat orphan receptor was used to screen the human fetal contain cDNA library. PCR was performed using the fetal brain cDNA library cas template and a 23-mer forward primer posns 162-1047 (AAAG2341). Six positive plaques were isolated and sequenced. The DNA was amplified using two oligo primers, USI and JS2 (AAQ52342, AAQ52343). They corresp. to the sequences corresplete to do PCR amplification of a DNA cloned in the plasmid's linker. CC possible to do PCR amplification of a DNA cloned in the plasmid's linker. CC specific synthetic primers (3 forward primers (AAQ52344) was selected for sequencing analysis. 4 creverse primer (AAQ52347) were used for manual sequencing of the hY1-5 clones and its deletion constructs. Three oligos necessary to study the inhibition of the contractile effect of neuropeptide Y on human blood conserved to the mineral sequencing of the human (13 masse mismatched antisense oligo hY1-M (AAQ52330). CC (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                            synthetic forward primer for the manual sequencing of human
asthma. This sequence represents a murine IL-5 receptor a DNA antisense oligonuclectide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding human neuro-peptide Y-peptide YY Y1 receptor - is used to develop drugs for treating e.g. hypertension, depression or obesity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a multidrug resistance-associated protein 1 (MRP -1) polynucleotide. The polynucleotide is useful in an in vitro method for identifying and containity a single nucleotide polynucphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug
                                                                                                                                                                                                                                                                                                                                                                                       Novel multidrug resistance-associated protein 1 polynucleotide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                resistance. This sequence represents a human MRP-1 polymorphic DNA region

The invention relates to a multidrug resistance-associated protein 1 (MRP -1) polynucleotide. The polynucleotide is useful in an in vitro method for identifying a single nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug resistance. This sequence represents a human MRP-1 polymorphic DNA region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel multidrug resistance-associated protein 1 polynucleotide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a multidrug resistance-associated protein 1 (WRP-1) polynucleotide. The polynucleotide is useful in an in vitro method cor identifying a single nucleotide polynucphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel multidrug resistance-associated protein 1 polynucleotide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.
                                                                                                                                                                                        The invention relates to a multidrug resistance-associated protein 1 (MRP-1) polymucleotide. The polymucleotide is useful in an in vitro method for identifying and sobtaining a single nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug resistance. This sequence represents a human MRP-1 polymorphic DNA region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; multidrug resistance-associated protein 1; MRP-1; ss; cancer; renal cancer; cytostatic; single nucleotide polymorphism.
                                                                                Novel multidrug resistance-associated protein 1 polynucleotide uses diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match 1.3%; Score 14.8; DB 1; Length 21; Best Local Similarity 88.9%; Pred. The invention relates to a multidrug resistance-associated protein 1 (MRP 1) polynucleotide. The polynucleotide is useful in an in vitro method for identifying a single nucleotide polynucphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug cancer. Novel multidrug resistance-associated protein 1 polynucleotide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms. resistance. This sequence represents a human MRP-1 polymorphic DNA region ö for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug resistance. This sequence represents a human MRP-1 polymorphic DNA region of the activity of a molecular variant of MRP-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a multidrug resistance-associated protein 1 (MRP -1) polynucleotide. The polynucleotide is useful in an in vitro method for identifying a single nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug resistance. This sequence represents a human MRP-1 polymorphic DNA region
                                                                                                                                                                                                                                                                                                                       Novel multidrug resistance-associated protein 1 polynuclectide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a ganome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine cridaes), polypeptide 5 (CYPSAS) polynucleotide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate cost of cosage and/or an appropriate derivative of (I). Therefore, undesirable, harmful treatment of those subjects who do not respond to the cotentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of creatment with substances (nonresponders), as well as the development of cury resistances due to suboptimal drug dosing can be avoided. ACF62200 co ACF62751 and ABM34912 to ABM35013 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant cancer, or malignant gliona in a subject having a genome with a variant cancer, or malignant gliona in a subject having a genome with a variant carcarior control or control or cytostatic activity. The therapeutic applications of (I) and (II) have correctively. The therapeutic applications of (I) is improved, gince it is possible to individually treat a subject with an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and treatment with substances (nonresponders), as well as the development of the respondence of the difference of the difference of the difference of the difference of the development of the treatment with substances (nonresponders), as well as the development of the treatment with substances (nonresponders), as well as the development of the treatment with substances (nonresponders), as well as the development of the treatment with substances (nonresponders) is prepresent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450,
                                                                                                                                 New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynuclectide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cancer; CYP3A5; irinotecan; pharmaceutical; malignant glioma; cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide 5; cytostatic; PCR primer; ss.

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant cancer, or malignant glioma in a subject having a genome with a variant condase), polypeptide 5 (CTPABA) polynucleotide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, cince it is possible to individually treat a subject with an appropriate derivative of (I). Therefore, undesirable, dasage and/or an appropriate derivative of (I). Therefore, undesirable, containally harmful treatment of those subjects who do not respond to the present with substances (nonresponders), as well as the development of the ACR62751 and ABM34912 to ABM35013 represent sequences used in the cemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cancer, CYP3A5; irinotecan; pharmaceutical; malignant glioma; cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide cytostatic; PCR primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for the use of irinotecan (I) or treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
oxidase), polypeptide 5 (CYP3A5) polynucleotide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate dosage and/or an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal drug dosing can be avoided. ACF62200 to ACF62751 and ABM34912 to ABM35013 represent sequences used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for the use of irinotecan (I) or tits derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant giloma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) to by puncleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant giloma in a subject, where the subject is a human (preferably African or a Anouse. The present sequence represents a sequence which is used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II). (I) has eytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                              Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1

The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; irinotecan; cancer; UGTIA1; cytostatic; topoisomerase I inhibitor; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member Al.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTAAl gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTAAL gene. The invention has cytostatic activity. A composition of the invention acts as a topologomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                         Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGT1A1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGT1A1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of irinotecan to treat cancer patient by determining if patient has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               88; irinotecan; cancer; UGT1A1; cytostatic; topoisomerase I inhibitor; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member A1.

                                                                                             The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIA1 gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIA1 gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAI gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAI gene. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIAl gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIAl gene product.
                   of irinotecan based on increased/decreased levels of UGT1A1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ss; irinotecan; cancer; UCT1A1; cytostatic; topoisomerase I inhibitor; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member A1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the novel use of irinotecan to treat a patient sulfering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIA1 gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIA1 gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
           topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer with as colorectal, cervical, gastric cancer, lung, ovarian, pare exemplication or mailgnant glioma. The present sequence is udes in the exemplification of the invention.

A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or mailgrant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                  New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; multidrug resistance 1; MDR1; cytostatic; human; ds; Cyp3A5; MRP1; MDR1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance I (MDRI) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  irinotecan; colorectal cancer; cervical cancer; gastric cancer;

The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises
                                                                                                                                                     The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or maingnant glioma in a subject having a genome with a variant allele which comprises a multidrug resistence I (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; multidrug resistance 1; MDR1; cytostatic; ds; human; UGT1A1; MRP1; TOP1.
                                           New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynuclectide.
                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance I (MDR1) polymucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polynucleotide useful for detecting single nucleotide polymorphisms in human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention
                                                                                                                                                                                              treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antidiabetic; Anorectic; Eating-Disorder; feeding behaviour; fat deposition; metabolic rate; lean muscle mass; body fat; Cbl; multi-adaptor protein; feeding disorder; glucose uptake disorder; metabolism disorder; diabetes; obesity; hyperlipidaemia; human; C-Cbl; siRNA; short interfering RNA; ds; RNA interference; gene silencing.

The present invention relates to a method for identifying a compound that is capable of modulating feeding behaviour, fat deposition, metabolic rate, or the ratio of lean muscle mass to body fat in a subject. The method comprises performing an assay to measure a metabolism-associated phenotype that has been determined for a genetically modified non-human animal that comprises a genetic modification within an allele of its Cblocus, and determining the effect of the compound on the phenotype. The genetic modification reduces or prevents expression of a functional

identifying compounds capable of modulating feeding behavior, fat deposition, metabolic rate, or the ratio of lean muscle mass to body fat by detecting a proto-oncogene Cbl in disorders such as diabetes, obesity

The present invention relates to a method for identifying a compound that is capable of modulating feeding behaviour, fat deposition, metabolic rate, or the ratio of lean muscle mass to body fat in a subject. The method comprises performing an assay to measure a metabolism-associated phenotype that has been determined for a genetically modified non-human animal that comprises a genetic modification within an allele of its Cbl cours, and determining the effect of the compound on the phenotype. The genetic modification reduces or prevents expression of a functional endogenous Cbl in the animal. The c-Cbl protein is a multi-adaptor protein that is involved in ligand-induced down regulation of receptor tyrosine kinases. The method of the invention is useful in the treatment of feeding disorders or disorders of glucose uptake and metabolism, such as diabetes, obesity and hyperlipidaemia. The present sequence is the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying compounds capable of modulating feeding behavior, fat deposition, metabolic rate, or the ratio of lean muscle mass to body fat by detecting a proto-oncogene Cbl in disorders such as diabetes, obesity and hypolipidemia.
                 protein that is involved in ligand-induced down regulation of receptor tyrosine kinases. The method of the invention is useful in the treatment of feeding disorders or disorders of glucose uptake and metabolism, such as diabetes, obesity and hyperlipidaemia. The present sequence is the sense strand for a human c-Cb1 siRNA. The siRNA is useful in modulating a metabolism-associated phenotype in a cell, tissue or animal subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antidiabetic; Anorectic; Eating-Disorder; feeding behaviour; fat deposition; metabolic rate; lean muscle mass; body fat; Cbl; multi-adaptor protein; feeding disorder; glucose uptake disorder; metabolism disorder; diabetes; obesity; hyperlipidaemia; human; c-Cbl; siRNA; short interfering RNA; ds; RNA interference; gene silencing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for detecting a cancer cell in a subject. The method comprises determining the level of expression of a GOBLIN gene in a sample of the subject where elevated expression of the gene is indicative of a primary cancer or its micrometastasis or metastasis. Also described: (1) an isolated GOBLIN nucleic acid molecule; (2) a vector comprising the isolated nucleic acid of (1); (3) a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting a cancer, e.g. breast or ovarian cancer, in a subject comprises determining the level of expression of a GOBLIN gene in a sample.

monoclonal or polyclonal antibody that binds specifically to a GOBLIN polypeptide, or its immunogenic coplippe; (5) a fusion protein comprising the isolated polypeptide of (4); (6) a method of identifying a compound that reduces or antagonises carpression of a GOBLIN gene; (7) a process for identifying or determining expression of a GOBLIN gene; (7) a process for identifying or determining expression of a GOBLIN gene; (7) an isolated nucleic acid that antagonises expression of a GOBLIN gene, where the nucleic acid that antagonises expression of a GOBLIN gene, where the nucleic acid comprises a nucleotide sequence comprising any of the 21 bp sequences of SEQ ID NOS:46-353; (9) an isolated antisense nucleic acid comprises a cubleotide sequence capable of selectively hybridising to mRNA encoded by contracted nucleic acid of (1); and (10) a process for monitoring the efficacy of treatment of a cancer in a subject. GOBLIN sequences have cytostatic activity, and can be used for producing an antibody. The efficacy of treatment of a cancer in a subject. GOBLIN sequences have cytostatic activity, and can be used for producing an antibody. The mucleic acid molecule can be used for producing an antibody. The carcinoma, hepatocellular carcinoma, melanoma, head and neck cancer, carcinoma, pastocellular carcinoma, melanoma, head and neck cancer, carcinoma, pastocellular carcinoma, melanoma, head and neck cancer, carcinoma, gastrointestinal cancer, bladder cancer, prostate cancer, con-squamous carcinoma, gastrointestinal cancer, bladder cancer, prostate cancer, con-squamous carcinoma, glioblastoma, melanoma, woratian cancer, con-squamous carcinoma, clear cell carcinoma, endometrioid ovarian cancer, or mucinous ovarian cancer), or breast cancer (e.g. lobular cancer, or mucinous ovarian cancer), or breast cancer (e.g. lobular cancer, or mucinous ovarian cancer), or breast cancer (e.g. lobular cancer, or mucinous ovarian cancer), or breast cancer (e.g. lobular cancer) at special ductal hyperplasia) in a subject. The antagonist o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               disease, like cancer. The present sequence represents a small interfering RNA (siRNA) oligonucleotide targeted to human GOBLIN, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer; GOBLIN; micrometastasis; metastasis; cytostatic; gene therapy; squamous cell carcinoma; hepatocellular carcinoma; melanoma; head and neck cancer; adenocarcinoma; gastrointestinal cancer; renal cell cancer; bladder cancer; prostate cancer; non-squamous carcinoma; glioblastoma; medullablastoma; ovarian cancer; mucinous ovarian cancer; breast cancer; lobular lesion; stromal lesion; ductal carcinoma; ductal adenocarcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             proliferative fibrocystic change; epitheliosis; intraductal papilloma; atypical ductal hyperplasia; hyperproliferative disease; human; small interfering RNA; siRNA; ss.

The present invention describes a method for detecting a cancer cell in a subject. The method comprises determining the level of expression of a combject. The method comprises determining the level of expression of a bubject. The method comprises determining the level of expression of the combject where a sindicative of a primary cancer or its micrometastasis or metastasis. Also described: (1) an isolated GOBLIN mucleic acid molecule; (2) a vector comprising the isolated GOBLIN bolypeptide, or its immungento opploagatide; (4) an isolated GOBLIN polypeptide, or its immongento opploagatide; (4) an isolated GOBLIN polypeptide, or its immongento opploagatide; (4) an isolated GOBLIN polypeptide, or its immongento opploagation of a GOBLIN gene, where the nucleic acid that antagonises and producing a compound; (8) an isolated nucleic acid that antagonises or syression of a GOBLIN gene, where the nucleic acid comprises a nucleic described antisense nucleic acid comprises a nucleotide sequence capable of selectively hybridishing to mRNA encoded by the isolated mucleic acid of (1); and (10) a process for monitoring the efficacy of treatment of a cancer in a subject. GOBLIN sequences have compound the activity, and can be used in gene therapy. An isolated GOBLIN contesting and the encoded polypeptides and molecules and molecules and the encoded polypeptides, and enthod mucleic acid molecules and the encoded polypeptides, and enthod mucleic acid molecules and the encoded polypeptides, and enthod mucleic acid molecules and the encoded polypeptides, and enthod mucleic acid molecules and the encoded polypeptides, and enthod mucleic acid molecules and the encoded polypeptides, and concertinoma, head and neck cancer. C carcinoma, hepatocellular carcinoma, melanoma, head and neck cancer, corructatic cancer), renal cell cancer (e.g. gastric, colon, or sacronoma, glioblastoma, dicar cancer, prostate cancer, or mucinous ovarian cancer, or breast cancer, prostate cancer, or mucinous ovarian cancer, or breast cancer (e.g. gastric, e.
                                                                                                                                                                                                                                                                                                                                                                             Detecting a cancer, e.g. breast or ovarian cancer, in a subject comprises determining the level of expression of a GOBLIN gene in a sample.

RESULT 202 ABL52014

The present invention describes an isolated polymucleotide (I) having a sequence (S1) comprising soluble carrier family 18 (vesicular monoamine), comparising soluble carrier family 18 (vesicular monoamine), member 2 (SLC18A2) isogenes with regions of a sequence (SS) of 40023 bp (see ABL51954), and defined by a corresponding set of polymorphisms whose locations and identities are given in the specification; or a sequence (S2) complementary to (S1). (I) has cut infilammatory and neuroleptic activities, and can be used in gene therapy. Methods from the present invention can be used for haplotyping the SLC18A2 gene in an individual. SLC18A2 is a slow known as the vesticular monoamine transporter (WMAT2). (I) is useful in studying the expression and function of SLC18A2, and in expressing the SLC18A2 correcting for candidate drugs to treat diseases content for use in screening for candidate drugs to treat diseases contents and activity of SLC18A2 as well as on the binding affinity of candidate drugs targeting SLC18A2 as well as on the binding affinity of candidate drugs targeting SLC18A2 so the treatment of respiratory of inflammatory diseases such as neuropsychiatric disorders involving contents of prince in systems. The present sequence represents an allele specific coligonal sourcheofied (ASO) primer for human SLC18A2, which is given /\*tag= a /\*tag= "polymorphic site indicated by an ambiguity base" monoamine; Novel genetic variants of soluble carrier family 18 (vesicular monoamine), member 2 gene useful for screening drugs to treat diseases e.g. neuropsychiatric disorders involving monoaminergic brain systems. ```
The invention relates to single nucleotide polymorphisms in the gene encoding the human cytotoxic T-lymphocyte-associated protein 4 or CTLA4 protein. A method for haplotyping the CTLA4 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the CTLA4 haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific pair of the CTLA4 gene can be identified by comparing the frequency of the haplotype pair in a population exhibiting the trait with the haplotype or haplotype pair in a reference population, where a higher haplotype frequency in the trait is associated with the haplotype or haplotype pair in a reference indicates the trait is associated with the haplotype or studying the expression and function of CTLA4 and its corresponding DNA are used for studying the expression and function of CTLA4 activity, such as autoimmume disorders. The sequences are also useful for studying the effect of variation on the

potassium channel proteins. The proteins of the invention have demaclogoical, antiinflammatory, keratolytic, vulnerary, and antipooriatic activity. The method is used especially in the field of damaged skin, e.g. contact dermatitis, atopic eczema, vitiligo, hyperkratosis, actinic keratosis, hypertrophic eczem, by hyperkratosis, actinic keratosis, hypertrophic acars, kebids, lentigo, aged skin, ulcers and especially psoriasis. The sequence represents a PCR primer for the mouse potassium channel protein mIKI of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis;

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA1761 to AAA1762 represent ribozyme sequences for ARNY, and AAA1761 to AAA1762 and AAA1763 and AAA1763 to AAA19154 represent their recresponding target sequences; corresponding target sequences; cand AAA19155 to AAA1922 represent their corresponding target sequences; cand AAA19155 to AAA1961 and AAA1960 to AAA1963 and AAA1962 represent their corresponding target sequences; cand AAA19159 to AAA2168 to AAA21680 to AAA21680 to AAA21680 represent their corresponding target sequences; cand integrin alpha 6 subunit, and AAA2332 to AAA2333 to AAA21680 to AAA21680 represent their corresponding target sequences; cand integrin subunit beta 3, and AAA23476 to AAA23343 to condition are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNY, are concerning angiofenic retinopathy, age related macular degeneration (ARND), inflammation, and arthritis, as well as macular degeneration (ARND), inflammation, and arthritis, as well as madiate and other syndrome of tuberous sclerosis, pot-wine stains, Sturge Weber conditions, inflammation, beta 3 and diseases related to the levels of ARND; inflammation, and arthritis, as well as and other syndromes and diseases related to the levels of ARNI, Tie-2, and other syndromes and diseases related to the levels of ARNI, Tie-2, and other syndromes and diseases related to the levels of ARNI, Tie-2, integrin subunit, all and the levels of ARNI, Tie-2, and other syndromes and disease related to the levels of ARNI, Tie-2, the arrive and other syndromes and disease related to the levels of ARNI, Tie-2, and other syndromes and disease related to the levels of ARNI, Tie-2, the arrive and oth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human GDMLP-1 17-mer scanning SEQ ID NO:4 sequence SEQ ID NO:2566.

The present invention describes a human genome-derived myosin-like correction 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 corrected acids can be used as probes to detect, characterise and quantify mucleic acids can be used as probes to detect, characterise and quantify correction variants having desired phenotyptic improvements, and for protein variants having desired phenotyptic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP cused as immunogens to raise antibodies that specifically recognise hGDMLP cused and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polyunclectide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart come and selectal muscle disorders. hGDMLP-1 is localised to chromosome 22. The sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence has a contracted in the internal part of the printed the present when the part of the printed the part of the part of the printed the part of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and/or amount specifically of HGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the HGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
